1) Consider an infinitely thin flat plate at an angle of attack of 15 deg in a Mach 8 flow. Assume inviscid flow. Calculate the pressure coefficients on the top and bottom surface of the plate, the lift and drag coefficients, and the lift-to-drag ratio using a) exact shock-wave and expansion-wave theory and b) Newtonian theory. Compare the results.

2) Find the drag on the below wedge (base height-1m) using Newtonian theory

3) Find the $C_D$ for circular cylinder using Newtonian Approximation.

4) Find the $C_D$ for hemisphere using Newtonian Approximation and then find the drag for sphere flying at Mach 10, using Newtonian Approximation, $T_{\text{infi}}$ = 200K , $P_{\text{infi}}$ = 120 pa, Radius =1m.

5) Find the $C_D$ for cone ( $\Theta_c$) using Newtonian Approximation.
